## Abstracts

The global Gel Filtration Media market size is expected to reach $ 424 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

Gel Filtration Media refers to porous particulate separation media used in gel filtration chromatography. It is commonly made from agarose, dextran, polyacrylamide, cellulose or synthetic polymers, and separates molecules based on differences in their ability to enter the pores of the media. Larger molecules are excluded from the pores and elute earlier, while smaller molecules enter the pores and elute later. Gel Filtration Media is widely used for the separation, purification, desalting, buffer exchange and molecular size fractionation of proteins, polysaccharides, nucleic acids, antibodies, viral particles and other biomolecules. Gel Filtration Media typically costs several thousand dollars per liter, with gross margins usually between 50% and 70%.

The upstream supply chain of Gel Filtration Media mainly includes matrix materials, crosslinking agents, functional reagents, buffers, packaging materials and precision particle manufacturing equipment. The pore size distribution, particle size uniformity, mechanical strength and chemical stability of the matrix materials directly determine product performance. Midstream manufacturers are responsible for media synthesis, crosslinking modification, particle size classification, washing, sterilization, quality control and commercial-scale packaging, offering different grades for research, process development and production use. Downstream customers mainly include biopharmaceutical companies, CDMOs, vaccine and plasma product manufacturers, diagnostic reagent and enzyme producers, academic research institutes and life science laboratories, with applications focused on protein purification, molecular size fractionation, desalting, buffer exchange, aggregate analysis and biomolecule polishing.

Gel Filtration Media is a mature and stable category within the bioprocess separation and purification market, mainly driven by demand from protein therapeutics, vaccines, plasma products, nucleic acid drugs and research-scale purification. Compared with affinity chromatography and ion exchange chromatography, Gel Filtration Media is more commonly used in polishing, molecular size fractionation, desalting and buffer exchange. Market growth is expected to remain steady, while demand for high-performance, mechanically robust and high-resolution media continues to rise with the development of biologics, viral vectors and complex biomolecule purification.
