## **Abstracts**

Ovarian cancer occurs and arises from several types of cells within the ovary, and it has the lowest survival rate of all gynecological cancers. Among many types, epithelial ovarian cancer (EOC) is the most common ovarian cancer, whereas ovarian low malignant potential tumor (OLMPT), germ cell tumor, and stromal ovarian tumor are some of the less common types. It is the seventh most common cancer in women globally and 18th most common cancer overall. The ovarian cancer immunotherapies market has already got some commercially successful chemotherapy products. However, chemotherapy often involves a combination of two or more drugs, given intravenously every 3-4 weeks, and mostly associated with long-lasting side/adverse effects. Various studies have shown that chemotherapy can damage the blood-producing cells of the bone marrow, resulting in blood-related complications.
