Abstracts

According to our (Global Info Research) latest study, the global Generator Control Unit market size was valued at USD 550.1 million in 2023 and is forecast to a readjusted size of USD 767.9 million by 2030 with a CAGR of 4.9% during review period.

In an electric power system, Generator Control Unit is a system for adjusting the power output of multiple generators at different power plants, in response to changes in the load. Since a power grid requires that generation and load closely balance moment by moment, frequent adjustments to the output of generators are necessary. The balance can be judged by measuring the system frequency; if it is increasing, more power is being generated than used, which causes all the machines in the system to accelerate. If the system frequency is decreasing, more load is on the system than the instantaneous generation can provide, which causes all generators to slow down.

GE, COMAP, DSE, Kohler and Emerson are the leading producers of generator control units, with the top 3 accounting for approximately 31% of the total market.

Europe is the largest production market, accounting for about 30% of the total market, followed by North America with about 29%.
