## Abstracts

According to our (Global Info Research) latest study, the global Geological Logger market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The geological catalog is a device used for underground original geological cataloging work. It can collect and process information on underground coal strata and geological structures, and realize the storage and sharing of geological spatial data and image data. It can help geologists take on-site photos, videos, sketches, columnar drawings, etc., and improve the quality and efficiency of geological cataloging. It can also be seamlessly connected with the geological information system to draw tunnel geological profiles and provide data support for mine safety production. Geological loggers are different from geological logging. Geological logging is a technology that collects, organizes, and analyzes stratigraphic information during drilling. It can discover and evaluate oil and gas layers, and help safe drilling and protection of oil and gas layers. Geological logging is a wellbore exploration technology that integrates geology, electronic machinery, chemical analysis, and computers.
