Abstracts

The global Geological Logger market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The geological catalog is a device used for underground original geological cataloging work. It can collect and process information on underground coal strata and geological structures, and realize the storage and sharing of geological spatial data and image data. It can help geologists take on-site photos, videos, sketches, columnar drawings, etc., and improve the quality and efficiency of geological cataloging. It can also be seamlessly connected with the geological information system to draw tunnel geological profiles and provide data support for mine safety production. Geological loggers are different from geological logging. Geological logging is a technology that collects, organizes, and analyzes stratigraphic information during drilling. It can discover and evaluate oil and gas layers, and help safe drilling and protection of oil and gas layers. Geological logging is a wellbore exploration technology that integrates geology, electronic machinery, chemical analysis, and computers.
