According to our (Global Info Research) latest study, the global Geophone Detector market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

The ground sound detector, also known as the seismic perimeter alarm detector, is a device used to detect seismic waves generated by ground intrusions (such as people walking, vehicles driving, etc.). The working principle of this detector is based on the propagation and identification technology of seismic waves. It can convert the detected seismic wave signals into electrical signals, and identify and analyze them through the processor to determine whether it is a real intrusion.
