Abstracts

Geosynthetic clay liners (GCLs) are factory manufactured hydraulic barriers consisting of a layer of bentonite or other very low-permeability material supported by geotextiles and/or geomembranes, mechanically held together by needling, stitching, or chemical adhesives. Due to environmental laws, any seepage from landfills must be collected and properly disposed off, otherwise contamination of the surrounding ground water could cause major environmental and/or ecological problems. The lower the hydraulic conductivity the more effective the GCL will be at retaining seepage inside of the landfill. Bentonite composed predominantly (70%) of montmorillonite or other expansive clays, are preferred and most commonly used in GCLs. A general GCL construction would consist of two layers of geosynthetics stitched together enclosing a layer of natural or processed sodium bentonite. Typically, woven and/or non-woven textile geosynthetics are used, however polyethylene or geomembrane layers or geogrid geotextiles materials have also been incorporated into the design or in place of a textile layer to increase strength. GCLs are produced by several large companies in North America, Europe, and Asia. The United States Environmental Protection Agency currently regulates landfill construction and design in the US through several legislations.

Scope of the Report:

This report focuses on the Geosynthetic Clay Liner in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. First of all, the increasing demand for Geosynthetic Clay Liner is expected to drive the market growth. This is because of the development of Containment & Wastewater Treatment, Landfill and Roadways & Civil Construction. Geosynthetic clay liners are

fabric-like materials utilized as linings to prevent seepage out of landfills. They act as a hydraulic barrier and incorporate two textile layers interconnected by bentonite clay, which is known to have low hydraulic conductivity. Second, increasing expenditure for infrastructure development in China, India, and Middle East countries in light of regulatory initiatives to enhance domestic output is expected to play an important role in amplifying market demand.

The worldwide market for Geosynthetic Clay Liner is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
