## Abstracts

According to our (Global Info Research) latest study, the global Geothermal Probes market size was valued at US\$ 700 million in 2025 and is forecast to a readjusted size of US\$ 930 million by 2032 with a CAGR of 4.1% during review period.

Geothermal probes, also known as ground source heat pumps or geothermal heat exchangers, are devices used to harness the stable temperature of the earth for heating and cooling purposes. These probes are typically installed vertically or horizontally in the ground and consist of pipes through which a heat-conducting fluid circulates. During winter, the fluid absorbs heat from the earth and transfers it to the building, while in summer, the process is reversed, with excess heat from the building being transferred back into the ground. This system is highly efficient and environmentally friendly, as it utilizes renewable geothermal energy, reducing reliance on fossil fuels and lowering greenhouse gas emissions.

In 2025, global Geothermal Probes production reached approximately 45,333 kilometers, with an average global market price of around US\$ 15 per meter.

The upstream supply chain of Geothermal Probes mainly includes PE100-RC/HDPE/PE-X pipe resin, U-bend probe feet, injection-molded fittings, manifolds, grout, sealing materials, heat-transfer fluids, electrofusion fittings, welding equipment, drilling consumables, pressure-testing tools, and engineering design services; downstream customers include ground-source heat pump installers, HVAC contractors, residential buildings, commercial buildings, public buildings, district heating projects, industrial facilities, agricultural facilities, and renewable energy engineering contractors. Geothermal probes are usually factory-welded and supplied as pre-assembled duplex

or double-U probes, commonly using PE100-RC or PE-X materials for closed-loop geothermal heat exchange systems.

The cost structure mainly includes plastic resin and pipe extrusion, probe foot and fittings, welding and pre-assembly, quality testing and certification, packaging, transportation, manifolds and accessories, engineering design, installation coordination, and channel margin. For the probe product itself, resin and pipe processing are the largest cost items; for a complete geothermal borehole project, drilling, grouting, labor, and installation are usually much larger than the probe material cost.
