Abstracts

According to our (Global Info Research) latest study, the global Getter Ion Pump market size was valued at US\$ 48.15 million in 2025 and is forecast to a readjusted size of US\$ 64.04 million by 2032 with a CAGR of 4.2% during review period.

The getter ion pump is a type of gas-capture pump specifically designed to achieve and maintain ultra-high or extremely high vacuum levels. It combines the dual properties of ionization and getter materials to achieve oil-free, vibration-free, and clean pumping; this is accomplished either by ionizing gas molecules and implanting them into the getter surface, or by utilizing chemical reactions to permanently sequester them within the material matrix.

The upstream segment of the industry primarily comprises components such as stainless steel ultra-high vacuum chambers, titanium/tantalum cathodes, anode assemblies, permanent magnets, high-voltage feedthroughs, and ceramic insulators. The midstream segment involves vacuum pump manufacturers undertaking processes such as pump body design, assembly, and vacuum encapsulation. In 2025, global sales volume for getter ion pumps is projected to reach approximately 6,000 units, with an average market price of approximately \$7,800 per unit; the gross profit margins for major manufacturers in the industry are expected to range between 35% and 50%.

Demand within the getter ion pump industry is driven primarily by the persistent need for clean ultra-high vacuum (UHV) across sectors such as semiconductor equipment, analytical instrumentation, aerospace, and quantum technology. The core value of these pumps lies in their oil-free operation, absence of moving parts, low vibration, and minimal maintenance requirements, as well as their ability to stably maintain a low-

contamination vacuum environment over extended periods within UHV and XHV systems. As requirements for vacuum stability, low magnetic interference, and miniaturization intensify?particularly in fields such as electron microscopy, surface analysis, particle accelerators, synchrotron radiation, ion traps, cold atom systems, and compact space payloads?the scope of application for ion pumps is poised to continue expanding.
