## Abstracts

The global Gingerol market size is expected to reach \$ 56.71 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

In 2025, the global production of gingerols was approximately 480 tons, with an average selling price of around US\$79 per kilogram. The scale of single-line production capacity varies depending on the production process and investment scale, with an average gross profit margin of approximately 15-25%. Gingerols are a group of active substances in ginger that give it its pungent and aromatic flavor. The main components include gingerols and shogaols, with 6-gingerol having the highest content and strongest activity. Gingerols possess various physiological activities, including antioxidant, anti-inflammatory, blood circulation promotion, stomach-soothing, anti-emetic, anti-tumor, and lipid-lowering effects, and are widely used in the food, pharmaceutical, and cosmetic industries.

The core upstream raw material for gingerols is ginger, whose quality, variety, and origin directly affect the effective component content and cost of the final extract. Downstream applications are mainly concentrated in two rapidly growing industries: firstly, the health food and functional food industry, where it is used as a natural active ingredient with anti-inflammatory, antioxidant, and digestive functions; and secondly, the high-end cosmetics and personal care industry, where it is used as a functional ingredient for anti-aging and skin soothing. Its value chain exhibits a typical "agricultural raw materials - bio-extraction - health and wellness consumption" characteristic.

This report studies the global Gingerol production, demand, key manufacturers, and key regions.
