## Abstracts

According to our (Global Info Research) latest study, the global Glass Recycling Sorting Equipment market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Glass recycling sorting equipments are advanced technologies and machinery designed to automate the process of sorting and separating glass materials from mixed waste streams. These equipments are commonly used in recycling facilities to efficiently extract glass containers and objects from mixed waste materials, including plastics, paper, metals, and organic waste. Glass recycling sorting equipments play a vital role in the recycling industry by increasing the efficiency of glass recovery and reducing the contamination of other recyclables.

They involve conveyor belts, screening, air classification, optical sorters, and other equipment to efficiently sort glass for recycling. Glass sorting systems typically begin with conveyor belts that transport mixed waste materials through the sorting process. To break down mixed waste materials into smaller pieces, shredders and screens are used. This process prepares the waste for efficient sorting. Optical sorting technology employs cameras and sensors to recognize and sort different types of materials, including glass. It can identify glass based on its color, shape, and other characteristics.

Glass recycling sorting equipments are critical in improving the quality of recycled glass materials, making them suitable for use in the manufacturing of new glass products. These equipments significantly reduce the environmental impact of glass production and contribute to resource conservation.
