Abstracts

According to our (Global Info Research) latest study, the global Glass Scale Linear Encoders market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Linear encoders are generally classified by their scanning technology — optical or magnetic. Magnetic encoders use a metal scale (often referred to as a “tape”), while optical encoders use a scale made of either metal or glass. Although magnetic encoders have seen great improvements in resolution and accuracy in recent years, for single-micron and sub-micron measuring resolution, optical encoders are still the better option. And of the two substrates available for optical encoders, glass substrates reign for applications that need resolutions down to the nanometer level.
