Abstracts

According to our (Global Info Research) latest study, the global Glassy Water market size was valued at USD 1269.7 million in 2023 and is forecast to a readjusted size of USD 1588.7 million by 2030 with a CAGR of 3.3% during review period.

The driving factors behind glassy water can be attributed several key factors:

1 Temperature: Glassy water typically forms at very low temperatures, close to the freezing point of water. As the temperature drops, the mobility of water molecules decreases, leading to the formation of a rigid or glassy state.

2. Pressure: High pressure conditions can also contribute to the formation of glassy water. When water is subjected to high pressures, it can stabilize in an amorphous or glass-like state rather than crystallizing into ice.

3. Impurities: The presence of impurities or additives in water can affect its ability to form a glassy state. Substances like salts or solutes can disrupt the hydrogen bonding between water molecules, altering their ability to form an organized ice lattice and facilitating the formation of a glassy state.

4. Cooling rate: The rate at which water is cooled can influence the formation of glassy water. Rapid cooling can prevent water molecules from aligning into an ordered crystal lattice, favoring the formation of a glassy state instead.

5. Confinement: Water confined within small spaces, such as porous materials or nanoscale structures, can exhibit glassy behavior due to restricted movement and increased surface interaction.
