Glenoid is the end of the scapula in the shoulder joint, meets the head of the humerus to form a glenohumeral cavity that acts as a flexible ball-and-socket joint. This therapy is used in shoulder replacement surgery. In this surgery, the damaged part of the shoulder is replaced with the artificial element known as a prosthesis. In this treatment of glenoid implantations, any part of the shoulder socket can be replaced it may be either the ball (head of the humerus) or socket called glenoid. Glenoid implantation is available in different sizes according to the body postures the size available are small, medium, large, and extra-large. There various side effects due to glenoid implantation rheumatoid arthritis, osteoporosis, degenerative arthritis, avascular necrosis, and fractures.
