Abstracts

Glioblastoma multiforme is the most aggressive variant of malignant brain cancer. It has a poor prognosis with low rate of survival, a median of one year. The primary brain tumor happens due to uncontrolled cell division and developments in the brain. The tumors can be found in the glial cells or the neuron. The one which develops in the glial cells (astrocytes and oligodendrocytes) is called glioma, the commonest forms of brain tumor. Scope of the Report:

This report focuses on the Glioblastoma Multiforme Therapeutics in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Currently unavailable therapies and prognosis for the treatment of GBM is expected to impact the market growth positively through to 2022. Presence of the treatment options which do not increase the overall survival rate in patients such as surgical resection, which is followed by chemotherapy and radiotherapy, is another factor attributing towards the expected growth of this market. Moreover, the fact that glioma stem cells resist conventional treatments also raises urgent need for alternative treatment therapies for glioblastoma multiforme thus driving the market. Increasing R&D in gene therapy and molecular biotechnology for the treatment of CNS associated disorders and cancer is anticipated to fuel the market growth over the forecast period. However, high expenditure involved in research employing genomics based research is a key restraint for market.

The worldwide market for Glioblastoma Multiforme Therapeutics is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from

xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
