Abstracts

The global Glycinamide Hydrochloride market size is expected to reach \$ 151 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Glycinamide hydrochloride is an amino acid derivative, belonging to the hydrochloride form of gamma amide. It is usually a white or off white crystalline powder with good water solubility and chemical stability. Its molecular structure contains both amino and amide groups, and can participate in various organic synthesis reactions. It is widely used as a pharmaceutical intermediate, organic synthesis raw material, and biochemical reagent. In the pharmaceutical field, this product is commonly used for synthesizing small molecule drugs and functional compounds; In the field of scientific research, it is used for buffer system construction and chemical reaction research, and is one of the important basic raw materials in fine chemical systems. In 2025, global Glycinamide Hydrochloride production reached approximately 654 MT, with an average global market price of around US\$ 168 per kg.

The market for glycinamide hydrochloride belongs to a typical niche fine chemical subdivision, with a relatively small overall scale but high added value, presenting industry characteristics of 'dispersed demand and obvious customization'. From the demand side, the products are mainly used in the fields of pharmaceutical intermediates and scientific research reagents, among which pharmaceutical research and development and small molecule drug synthesis are the core driving forces. With the continuous increase in global investment in innovative drug research and development, the demand for high-purity amino acid derivatives is steadily increasing; From the supply side, the production process of this product is relatively mature but requires high purity control and impurity management, with moderate barriers to entry into the industry. Chinese companies dominate the global supply, while European, American,

and Japanese companies have an advantage in the high-purity reagent grade market. In the future, with the increase of pharmaceutical research and development activities and the growing demand for customized synthesis, the market will maintain moderate growth. However, due to relatively limited application areas, the overall expansion space is limited, and the industry will still maintain a development pattern of 'small-scale, high added value'.
