Abstracts

Glycomics is the comprehensive study of glycomes (the entire complement of sugars, whether free or present in more complex molecules of an organism), including genetic, physiologic, pathologic, and other aspects.

Scope of the Report:

Glycomics 'is the systematic study of all glycan structures of a given cell type or organism' and is a subset of glycobiology.

The term glycomics is derived from the chemical prefix for sweetness or a sugar, 'glyco-', and was formed to follow the omicsnaming convention established by genomics (which deals with genes) and proteomics (which deals with proteins).

The complexity of sugars: regarding their structures, they are not linear instead they are highly branched. Moreover, glycans can be modified (modified sugars), this increases its complexity.

The worldwide market for Glycomics is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
