## Abstracts

According to our (Global Info Research) latest study, the global GMO Testing Equipment and Services market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Genetically modified organisms (GMOs) are organisms whose genetic material has been altered through unnatural mating and/or natural recombination. Many plants used in food production have genetically modified forms: corn, soybeans, canola, cotton, and more. European law only allows certain species to be used in food and animal feed. Products from these plants are produced into thousands of different food products, such as breakfast cereals, confectionery, chocolate, meat products, prepared foods and animal feed. The detection, identification and quantification of GMOs are based on PCR technology (polymerase chain reaction). This technology can identify specific DNA gene sequences in raw material samples. The high stability of DNA compared to proteins makes it particularly suitable for GMO detection, especially in delicatessen or Other heat-treated products. This analysis can be used to determine the general sequence (p35S promoter or tNos terminator) present in most of the transgenic varieties that have been authorized or are still in the authorization review process, or the specific genes of a certain transgenic variety. Continental Analytical has extensive experience in the following aspects: complex sample preparation; qualitative/quantitative PCR detection of genetically modified genes; taking into account the geographical origin and the special needs of customers, we provide consultation on the best detection methods for each product.
