Abstracts

Gold nanospheres are nanoscale particles composed predominantly of gold atoms arranged in a spherical shape. These nanospheres typically have diameters ranging from a few to a few hundred nanometers. Gold nanospheres exhibit unique optical, electronic, and catalytic properties due to their small size and high surface area-to-volume ratio. Gold nanospheres find applications in various fields such as biomedicine, catalysis, sensing, and electronics. In biomedicine, they are used for drug delivery, imaging, and therapy due to their biocompatibility and ability to be functionalized with targeting ligands or therapeutic agents. In catalysis, they serve as effective catalysts in various chemical reactions due to their high surface area and unique electronic properties. Furthermore, gold nanospheres are used in sensors for detecting various analytes such as biomolecules, gases, and ions. In electronics, they are incorporated into devices for applications such as plasmonic sensing, photodetection, and optoelectronics. Overall, gold nanospheres are versatile nanomaterials with a wide range of applications, particularly in biomedical and catalytic fields, owing to their unique properties at the nanoscale.

According to our (Global Info Research) latest study, the global Gold Nanosphere market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Spherical gold nanoparticles usually exhibit a spherical, round, or near-spherical morphology, which can have a high degree of uniformity at the nanoscale. Spherical gold nanoparticles exhibit obvious surface-enhanced Raman scattering (SERS) effect, with good catalytic activity and selectivity.
