Abstracts

The global Gold(III) Bromide (AuBr₃) market size is expected to reach \$ 38.25 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

In 2025, global Gold(III) Bromide (AuBr₃) production reached approximately 150 kg, with an average global market price of around 160 US\$/g.

Gold(III) Bromide (AuBr₃), also known as auric bromide or gold tribromide, is an inorganic precious-metal halide composed of gold in the +3 oxidation state and bromide ions. It is usually supplied as a dark red to brown crystalline or powder material and is mainly used as a high-value specialty reagent rather than a bulk industrial chemical. Because of its strong Lewis acidity, noble-metal activity, and ability to participate in gold-catalyzed reactions, it is applied in organic synthesis, homogeneous catalysis, organometallic chemistry, nanomaterial preparation, and advanced materials research. It is moisture-sensitive and corrosive, so commercial products are commonly supplied in small sealed packages with high-purity specifications for laboratory, pharmaceutical research, electronic materials, and catalyst development applications.

Demand for Gold(III) Bromide is driven by research-intensive and high-value applications, especially gold-catalyzed organic synthesis, pharmaceutical intermediate development, nanogold precursor preparation, specialty catalyst screening, and advanced electronic or optical material R&D. The market is small in volume but high in unit value, with purchases typically made in gram-scale or customized small-batch quantities. Business opportunities are concentrated in high-purity AuBr₃, anhydrous grades, custom synthesis, precious-metal compound recycling, secure packaging, and localized supply for universities, pharmaceutical companies, fine chemical producers, and materials laboratories. Growth potential comes from expanding catalytic chemistry,

nanomaterials, semiconductor-related research, and demand for reliable precious-metal reagent supply, while limitations include high gold raw-material cost, hazardous handling requirements, moisture sensitivity, and substitution by other gold salts or gold complexes.
