## Abstracts

According to our (Global Info Research) latest study, the global Golidocitinib market size was valued at US\$ 233 million in 2025 and is forecast to a readjusted size of US\$ 968 million by 2032 with a CAGR of 16.3% during review period.

Golidocitinib is a highly selective, orally bioavailable small-molecule JAK1 inhibitor, mainly used for the treatment of hematologic malignancies such as relapsed or refractory peripheral T-cell lymphoma. The drug specifically inhibits the JAK-STAT signaling pathway, blocking abnormal cell proliferation and inflammatory signal transduction, thereby suppressing tumor cell growth and delaying disease progression. As a new generation of targeted antineoplastic agents, golidocitinib features high target selectivity, low off-target effects, and controllable clinical safety. It provides a new therapeutic option for patients with relapsed and refractory lymphoma and represents one of the important innovative targeted drugs in the field of lymphoma. In 2025, global Golidocitinib production reached approximately 110,000–120,000 bottles.

As a globally first-in-class highly selective JAK1 inhibitor, golidocitinib has precisely filled the long-standing clinical gap in the treatment of relapsed and refractory peripheral T-cell lymphoma since its launch. With its unique mechanism of action and significant survival benefits, it has rapidly established a core position in the targeted market. Relying on its globally exclusive target, breakthrough therapeutic efficacy, and highest-level recommendations from authoritative clinical guidelines, the drug has built strong market competitiveness and technical barriers. Following its inclusion in medical insurance, its accessibility has been greatly improved, market penetration and patient coverage continue to expand, and the commercialization process has accelerated significantly. In terms of competitive landscape, it enjoys obvious first-mover advantages, while similar competitors remain in late-stage clinical development, making

it difficult to challenge its dominant position in the short term. Meanwhile, with the active expansion of multiple indications such as first-line treatment, combination therapy, and other T-cell lymphoma subtypes, golidocitinib is extending from second-line salvage therapy to full-course disease management, continuously unlocking its market potential and product life cycle. In the future, it is expected to further consolidate its benchmark value in the global targeted therapy for hematologic malignancies through its differentiated advantages and international layout.
