## Abstracts

According to our (Global Info Research) latest study, the global Governed Enterprise Architecture Scenario Sandbox market size was valued at US\$ 731 million in 2025 and is forecast to a readjusted size of US\$ 1963 million by 2032 with a CAGR of 15.3% during review period.

Governed Enterprise Architecture Scenario Sandbox refers to software platforms and related services that let organizations create isolated, permission-aware architecture scenarios to model future states, compare design options, simulate transitions, and expose architecture context to AI without altering the production baseline. These platforms typically include repository branching and comparison features, decision and transition planning environments, governance layers for AI/human access, and implementation/advisory services. Unlike traditional architecture repositories that excel at recording current states but struggle with structured what-if analysis, scenario sandboxes provide safe environments for experimentation where teams can design changes, compare transition states, and conduct governed reviews before decisions flow back to the baseline. Key capabilities include scenario modeling, decision tracking, transition simulation, repository governance, AI-compatible access patterns, and governance controls. From a value chain perspective, upstream includes cloud infrastructure providers, AI model vendors, and professional services; midstream involves software platform development, integration services, and managed services; downstream demand spans BFSI, government and defense, healthcare, manufacturing, IT and telecom, and energy sectors.

The governed enterprise architecture scenario sandbox market is undergoing a fundamental transformation as enterprises shift from static architecture documentation

to dynamic, AI-assisted planning environments. Traditional architecture repositories have been effective at recording current-state architectures, but they offer limited support for structured what-if analysis. Scenario sandboxes solve this by providing dedicated environments where teams can design future-state changes, compare multiple transition options, and conduct governed reviews before committing to architectural decisions. Ardoq, for example, treats scenario modeling as a central architecture capability, positioning it as a structured way to manage future-state decisions with a data-driven approach akin to Git branching mechanisms.
