## Abstracts

According to our (Global Info Research) latest study, the global Government Information Construction Service market size was valued at US\$ 2769 million in 2025 and is forecast to a readjusted size of US\$ 5415 million by 2032 with a CAGR of 10.1% during review period.

Government information construction services refer to the use of advanced information technology and solutions to provide comprehensive IT infrastructure and application support for governments and public institutions to achieve digital, intelligent and efficient government management. These services cover the information needs of various government departments and fields, including e-government platforms, data center construction, smart city solutions, security management, financial systems, electronic certificates, public security, etc., aiming to improve the quality of public services, promote the modernization of governance capabilities, and support government decision-making and facilitate citizen services.

The value chain of government information technology construction services generally consists of upstream infrastructure and technology providers, midstream platform development and system integrators, and downstream implementation, operation, and value-added service providers: The upstream includes cloud computing and IDC service providers, network and security infrastructure suppliers, and database/middleware and general software vendors. Their products are relatively standardized, resulting in relatively low gross profit margins (typically 15%–30%). The midstream comprises providers of government information platforms, industry business systems (such as e-government portals, government collaborative office systems, and data exchange/sharing platforms), system integration, and customized development

services. This is the core link of the value chain, and due to its high technological content and complex delivery, the gross profit margin for software development and system integration is generally higher (approximately 30%–55%). The downstream includes service providers for project implementation, operation and maintenance support, data governance and security services, long-term hosting, and continuous optimization. These services provide relatively stable recurring revenue, with operation and maintenance service gross profit margins typically ranging from 25%–45%, and overall project profitability can be enhanced through value-added consulting and industry solutions. Overall, the government information technology construction service value chain exhibits a typical profit distribution pattern: lower gross margins for infrastructure hardware/general software, the highest gross margins for midstream software development and integration, and stable profits from operation services.

Government information construction services play an indispensable role in modern society. They are not only a tool to improve government management efficiency and service quality, but also a key step in promoting the modernization of government governance capabilities. By introducing advanced information technology and management methods, these services help the government achieve an important leap from traditional administrative means to digital and intelligent transformation. They not only promote the transparency and efficiency of government management, but also strengthen the interaction and communication between the government and citizens and enterprises, and promote the common goal of social progress and sustainable development. Therefore, government information construction services are not only an important support for modern governance, but also one of the important strategies to maximize public interests.
