According to our (Global Info Research) latest study, the global GPCR-targeting Drug market size was valued at USD 413.6 million in 2022 and is forecast to a readjusted size of USD 491.3 million by 2029 with a CAGR of 2.5% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

GPCRs or G protein-coupled receptors are proteins located on the cell surface that recognize extracellular substances and transmit signals across the cell membrane. GPCRs do this by activating guanine nucleotide-binding proteins (G protein) that are responsible for signal transduction inside the cell. The signal delivery is very important in various cellular responses including cell growth, gene transcription, post-translational changes, and communication with other cells. This brings on adjustments in the body to adapt to the environmental changes such as increased heart rate when feeling threatened or change in vision in response to dim light.
