## Abstracts

The global GPCR-targeting Drug market size is expected to reach \$ 491.3 million by 2029, rising at a market growth of 2.5% CAGR during the forecast period (2023-2029).

GPCRs or G protein-coupled receptors are proteins located on the cell surface that recognize extracellular substances and transmit signals across the cell membrane. GPCRs do this by activating guanine nucleotide-binding proteins (G protein) that are responsible for signal transduction inside the cell. The signal delivery is very important in various cellular responses including cell growth, gene transcription, post-translational changes, and communication with other cells. This brings on adjustments in the body to adapt to the environmental changes such as increased heart rate when feeling threatened or change in vision in response to dim light.

This report studies the global GPCR-targeting Drug demand, key companies, and key regions.
