Abstracts

According to our (Global Info Research) latest study, the global GPIO Expanders market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A GPIO expander is a device that enables designers to implement additional inputs and outputs (I / O) on a microprocessor (MPU) or microcontroller (MCU) system. They have an efficient data bus interface to reduce the I / O requirements of the MPU or MCU. This is usually a synchronous serial interface, such as SPI or I2C. They enable designers to incorporate more I / O in a system than the capacity available on the processor device the designer is using. They also enable the I / O to be physically located in a system separate from the processor, facilitating printed circuit board layout and improving signal integrity.
