According to our (Global Info Research) latest study, the global GPU-accelerated AI Servers market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

There is a significant difference between AI servers and traditional servers. AI servers are high-performance servers specially designed to perform computationally intensive tasks such as artificial intelligence, machine learning (ML), and deep learning (DL). It can learn how to run the server efficiently by collecting data, analyzing data, and simulating data. It can also adjust the performance of the server according to different applications and user requests to provide better server performance. Although traditional servers can also process large amounts of data, manual intervention is required to improve server performance. From a technical perspective, GPU cards account for 90% of the market share.
