Gradient Ratio Test Apparatus is a device used to measure the permeability performance of materials (such as geotextiles, geological fabrics, etc.) under different hydraulic gradients. It determines the gradient ratio of the material, that is, the ratio of the water content change rate of the sample to the average flow velocity, by simulating the permeation environment of the material in practical applications and measuring the changes in the permeation flow rate of the material and the water content of the sample under different hydraulic gradients. This kind of test is crucial for evaluating the performance of materials in applications such as filtration, drainage and seepage prevention.
