Abstracts

The global Granular Epoxy Mold Compound (EMC) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

EMC is used in the semiconductor industry to protect and provide mechanical support to delicate IC chips. It is typically applied during the chip packaging process, where the IC chip is placed on a lead frame or substrate, and the EMC material is molded around it to create a protective encapsulation.

The granular form of EMC allows for precise control and dispensing of the material during the packaging process. The granules are typically heated to a molten state and then injected or transferred into the mold cavity where the IC chip is positioned. The material then solidifies and forms a protective and hermetic seal around the chip.

The epoxy resin in the EMC provides mechanical strength and adhesion, while the filler materials enhance the thermal conductivity, electrical insulation, and dimensional stability of the compound. Hardeners and additives are included to control the curing process and improve the overall performance of the EMC.

Granular EMCs offer advantages such as high thermal conductivity, good electrical insulation, low moisture absorption, and excellent adhesion to various substrates. These properties make it an ideal material for protecting and packaging IC chips, ensuring their reliability and longevity in electronic devices.

Granular Epoxy Mold Compound (EMC) refers to a type of material used in the encapsulation and packaging of integrated circuits (ICs) and electronic components. It is

a mixture of epoxy resin, filler materials, hardeners, and other additives that are combined into granular form.
