Graphene-based solid-state flexible lithium-ion battery is a new type of battery technology that applies graphene material to the positive and negative electrodes and electrolyte layer of the battery, achieving high energy density, high safety, and flexibility.

Graphene-based solid-state flexible lithium batteries can overcome the technical difficulties of solid-state lithium batteries, with advantages such as high energy density, flexibility and foldability, and stable cyclic performance. The potential for commercial development is unlimited

Graphene-based solid-state flexible batteries can overcome the technical difficulties of solid-state batteries, with advantages such as high energy density, flexibility and foldability, and stable cyclic performance. The potential for commercial development is unlimited.

Specifically, graphene is a two-dimensional material composed of carbon atoms with high conductivity, mechanical strength, and surface area. In the graphene-based solid-state flexible lithium-ion battery, graphene is used as the material for the positive and negative electrodes and the electrolyte layer of the battery, which improves the energy density and charging/discharging efficiency of the battery. At the same time, due to the

flexibility and bendability of graphene itself, the graphene-based solid-state flexible lithium-ion battery also has good flexibility and plasticity, and can work under bending or stretching conditions, which has important application value in some special application scenarios.
