## Abstracts

The global Graphene-enhanced Additives for Cement market size is expected to reach \$ 85.29 million by 2032, rising at a market growth of 14.6% CAGR during the forecast period (2026-2032).

Graphene-enhanced additives for cement are functional admixtures that incorporate a small amount of graphene or its derivatives, such as graphene oxide or reduced graphene oxide, into conventional cement or concrete systems. Owing to their extremely high specific surface area, outstanding mechanical properties, and strong interfacial interaction capability, these additives regulate cement hydration and refine the microstructure, leading to denser hydration products and improved load transfer. In 2025, global graphene-enhanced additives for cement sales reached approximately 4,000 tons, with an average price of 8 US\$/Kg. Global production capacity is approximately 6,000 kilotons per year, with a gross profit margin of approximately 35%–55%.

Upstream supplies include graphene/graphene oxide nano-carbons plus dispersants and carrier chemicals, midstream players formulate and disperse these into finished admixtures with QC, and downstream users (cement plants, ready-mix & precast producers, and contractors) adopt them in performance- and durability-driven cementitious applications.

Adoption is primarily driven by the construction sector's demand for higher performance and longer service life in infrastructure, where durability and crack control translate into lower lifecycle costs. A second driver is decarbonization pressure: if an admixture enables comparable strength with reduced cement content, it directly supports embodied-carbon reduction goals in concrete. Finally, the commercialization pathway is

helped by “batch-plant compatible” dosing (liquid admixture formats and drop-in integration), which lowers operational barriers for ready-mix and precast producers.

This report studies the global Graphene-enhanced Additives for Cement production, demand, key manufacturers, and key regions.
