Abstracts

According to our (Global Info Research) latest study, the global Graphene-enhanced Additives for Cement market size was valued at US\$ 32.93 million in 2025 and is forecast to a readjusted size of US\$ 85.29 million by 2032 with a CAGR of 14.6% during review period.

Graphene-enhanced additives for cement are functional admixtures that incorporate a small amount of graphene or its derivatives, such as graphene oxide or reduced graphene oxide, into conventional cement or concrete systems. Owing to their extremely high specific surface area, outstanding mechanical properties, and strong interfacial interaction capability, these additives regulate cement hydration and refine the microstructure, leading to denser hydration products and improved load transfer. In 2025, global graphene-enhanced additives for cement sales reached approximately 4,000 tons, with an average price of 8 US\$/Kg. Global production capacity is approximately 6,000 kilotons per year, with a gross profit margin of approximately 35%–55%.

Upstream supplies include graphene/graphene oxide nano-carbons plus dispersants and carrier chemicals, midstream players formulate and disperse these into finished admixtures with QC, and downstream users (cement plants, ready-mix & precast producers, and contractors) adopt them in performance- and durability-driven cementitious applications.

Adoption is primarily driven by the construction sector's demand for higher performance and longer service life in infrastructure, where durability and crack control translate into lower lifecycle costs. A second driver is decarbonization pressure: if an admixture

enables comparable strength with reduced cement content, it directly supports embodied-carbon reduction goals in concrete. Finally, the commercialization pathway is helped by “batch-plant compatible” dosing (liquid admixture formats and drop-in integration), which lowers operational barriers for ready-mix and precast producers.
