## Abstracts

According to our (Global Info Research) latest study, the global Graphene Oxide (GO) market size was valued at US\$ 55.75 million in 2025 and is forecast to a readjusted size of US\$ 730 million by 2032 with a CAGR of 44.9% during review period.

Today's graphene is normally produced using mechanical or thermal exfoliation, chemical vapour deposition (CVD), and epitaxial growth. One of the most effective way of synthesised graphene on a large scale could be by the chemical reduction of graphene oxide. Since the first report on mechanical exfoliation of monolayer graphene in 2004, interest in graphite oxide (which is produced by oxidation of graphite) has increased dramatically as people search for a cheaper, simpler, more efficient and better yielding method of producing graphene, that can be scaled up massively compared to current methods, and be financially suitable for industrial or commercial applications.

While graphite is a 3 dimensional carbon based material made up of millions of layers of graphene, graphite oxide is a little different. By the oxidation of graphite using strong oxidizing agents, oxygenated functionalities are introduced in the graphite structure which not only expand the layer separation, but also makes the material hydrophilic (meaning that they can be dispersed in water). This property enables the graphite oxide to be exfoliated in water using sonication, ultimately producing single or few layer graphene, known as graphene oxide (GO). The main difference between graphite oxide and graphene oxide is, thus, the number of layers. While graphite oxide is a multilayer system in a graphene oxide dispersion a few layers flakes and monolayer flakes can be found.

Note: Graphene oxide has two types: powder and dispersions. Graphene oxide can be dispersed into a range of concentration solution. Because graphene oxide dispersions are dispersed in various solutions at different concentrations, the lower the concentration, the lower the price. Many manufacturers can provide products to industrial customers in large batches of dispersions. The price and sales volume caused by different concentrations are difficult to calculate, this report Unit conversion is used. In this report, the capacity and production of graphene oxide dispersions is converted into 100% content GO dry weight.

USA is the largest market with about 55% market share. Europe and China are follower, accounting for about 41% market share.

The key players are Global Graphene Group, Graphenea, Abalonyx AS, Garmor, ACS Material, Cheap Tubes, The Sixth Element Materials, BGT Materials Limited (BGT, Allightec, E WAY Technology, Jining LeaderNano Tech, Nanoinnova etc. Top 3 companies occupied about 55% market share.
