Abstracts

The global Graphics Processing Unit (GPU) market size is expected to reach \$ 66770 million by 2029, rising at a market growth of 11.1% CAGR during the forecast period (2023-2029).

Global 5 largest manufacturers of Graphics Processing Unit (GPU) are Nvidia Corporation, Advanced Micro Devices (AMD), Intel Corporation, ARM Limited and Qualcomm, which make up over 80%. Among them, Nvidia Corporation is the leader with about 40% market share.

In terms of product types, Graphics Processing Unit (GPU) can be divided into two types: Independent GPU and Integrated GPU. Independent GPU occupies the largest share of the total market, more than 95%. In terms of product application, Graphics Processing Unit (GPU) is mainly used in Games and Entertainment, Data center, Professional visualization and Car. Games and Entertainment occupy the largest share of the total market, about 66%.

GPU, also known as display core, visual processor and display chip, is mainly used as the computing core of graphics card to solve the problem of graphics rendering.

At the beginning of PC's birth, there was no concept of GPU, and all graphics calculation was done by CPU. However, the speed of using CPU to do graphics calculation is slow, so a special graphics accelerator card is designed to help with graphics calculation. Later, NVIDIA proposed the concept of GPU, which promoted the GPU to the status of a separate computing unit. CPU is generally composed of logic operation unit, control unit and storage unit. Although the CPU has multiple cores, the total number is not more than two digits, and each core has enough cache; the CPU

has enough number and logical operation units, and has many hardware to accelerate branch judgment and even more complex logical judgment. Therefore, the CPU has super logical ability.

Compared with CPU, the advantage of GPU lies in multi-core, the number of cores is far more than that of CPU, which can reach hundreds, each core has relatively small cache, and digital logic operation unit is small and simple; while CPU generally only has 8 cores at most, which is generally used to process calculation data with more complex calculation amount. Therefore, GPU is more suitable for data parallel computing than CPU. When rendering graphics, a large number of 3D coordinates need to be converted into 2D coordinates, and the coordinates of each individual position must be calculated. Although the coordinate calculation is not complicated, the huge amount of data is not borne by CPU. If CPU is used to calculate, it will not only waste the huge computing power of ALU, but also its parallel data processing ability is not enough.
