According to our (Global Info Research) latest study, the global Graphite Dry Film Lubricant market size was valued at US\$ 140 million in 2025 and is forecast to a readjusted size of US\$ 197 million by 2032 with a CAGR of 5.1% during review period.

In 2025, the global production of graphite dry film lubricant reached approximately 1,432 tons, with an average global market price of around US\$95 per kilogram. In the same year, the global total production capacity of graphite dry film lubricant reached 1,790 tons. The industry average gross profit margin of this product reached 27%.

Graphite dry film lubricant uses natural or artificial graphite micropowder as the core solid lubricating phase. Graphite is uniformly dispersed in a resin, solvent, or aqueous dispersion system and then coated onto the surface of a metal or composite material. After curing, it forms a solid lubricating film with a layered slip structure. This film provides low friction coefficient, high temperature resistance, wear resistance, and anti-galling properties even in oil-free or extreme environments, thus replacing traditional grease lubrication and achieving long-term maintenance-free or low-maintenance operation.

The upstream of the graphite dry film lubricant industry chain mainly includes natural flake graphite, artificial graphite and high-purity graphite powder, resin matrix, solvents, and functional additives. The midstream consists of dry film lubricant coating manufacturers and formulation companies, which uniformly embed graphite into the resin system to form a stable coating through grinding dispersion, ball milling, spraying, or dip coating processes. Downstream applications are concentrated in high-end mechanical systems with strict requirements for high temperature, low friction, and oil-

free lubrication, such as aerospace fasteners, automotive door locks and slide rails, industrial molds, metallurgical equipment, valve bearings, rail transportation, and military equipment.

Graphite dry film lubricants are expected to maintain steady growth, driven primarily by the continued demand for reliable lubrication systems from high-temperature, heavy-duty industrial equipment, aerospace, and defense industries, as well as environmental regulations pushing traditional grease lubrication towards dry lubrication. Meanwhile, the increasing demands for 'pollution-free, low-volatility, and long-life lubrication' from new energy vehicles, automated equipment, and semiconductor manufacturing equipment are expanding their application scope. However, their growth rate is slightly lower than that of PTFE systems because some applications are being replaced by PTFE or MoS₂ composite coatings. Future technological trends will focus on 'graphite + PTFE + ceramic nanocomposite coatings' and low-VOC waterborne systems to improve wear resistance, cleanliness, and environmental compatibility.
