According to our (Global Info Research) latest study, the global Grating-Coupled Interferometry (GCI) market size was valued at US\$ 95.61 million in 2025 and is forecast to a readjusted size of US\$ 163 million by 2032 with a CAGR of 8.0% during review period.

Grating-Coupled Interferometry (GCI) is a recently developed chip-based non-labelled biosensor technology with high sensitivity. It differs from traditional molecular interaction techniques that rely on fluorescence and immunological labels by combining high signal-to-noise ratio, high temporal resolution, and compatibility with crude samples, thus breaking through the research impasse of molecular interactions. Through GCI technology, a complete set of information describing molecular interactions can be obtained quickly, accurately, and reliably, including the presence or absence of binding, the specificity of binding, the affinity that describes the strength of binding, and the kinetic constants that describe the speed and stability of binding.
