A gravity autoclave is a type of sterilization device that uses steam under pressure to eliminate microorganisms, including bacteria, viruses, and spores, from surgical instruments, laboratory equipment, and other materials. In a gravity autoclave, steam is introduced into the chamber, and as it is heavier than air, it forces the air out through a drain at the bottom of the chamber. This process ensures that the steam penetrates all surfaces of the items being sterilized. Gravity autoclaves are commonly used in medical, dental, and laboratory settings due to their effectiveness, simplicity, and ability to sterilize a wide range of materials, including heat-sensitive items. They are particularly well-suited for sterilizing unwrapped or loosely wrapped items, where the gravity displacement of air is most effective.
