## Abstracts

The global Green Marine Fuels market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Green marine fuels, also known as sustainable marine fuels or alternative marine fuels, refer to environmentally friendly and low-carbon fuel options used to power ships and vessels. These fuels are intended to reduce the environmental impact of the shipping industry, which traditionally relies on fossil fuels that contribute to air pollution and greenhouse gas emissions. Green marine fuels are considered a key part of efforts to decarbonize and make maritime transportation more sustainable. Several types of green marine fuels are emerging, and they include: Hydrogen, Ammonia, Methanol and Biodiesel and Biofuels, etc.

The adoption of green marine fuels is driven by international regulations to reduce emissions from the shipping industry, including the International Maritime Organization's (IMO) goals to reduce sulfur emissions and greenhouse gas emissions. As the maritime industry transitions toward a more sustainable future, the use of green marine fuels is expected to increase, contributing to a cleaner and greener shipping sector.
