Abstracts

According to our (Global Info Research) latest study, the global Green Packaging market size was valued at USD 138460 million in 2023 and is forecast to a readjusted size of USD 189600 million by 2030 with a CAGR of 4.6% during review period.

Packaging is an important characteristic that helps in attracting customers. Brands and products try to incorporate the brand image, value proposition, and information about the product in the packaging of the product. Green packaging is one of the packaging techniques which is eco-friendly. It is highly in demand as it uses recyclable materials for the packaging process. Due to the use of organic materials, green packaging does not emit greenhouse gases like carbon dioxide and methane or ozone depleting volatile substances. They help reduce environmental impact and therefore have great potential to be used in the food and beverage industry on a larger scale.

Key industry trends include downsizing or light weighting, increasing recycling and waste recovery, growing use of renewably sourced materials, rising use of recycled content, and improvements in packaging and logistical efficiency. Favorable regulatory inclinations in Europe are anticipated to boost the bioplastics packaging market in the near future. For instance, implementation of Horizon 2020 strategy by European Commission has resulted in increasing development of new bio-based products. However, fluctuating raw material prices may hinder industry growth over the forecast period. High cost of production also threaten to limit industry participation, especially smaller and newer players.
