According to our (Global Info Research) latest study, the global Green Picosecond Laser market size was valued at US\$ 297 million in 2024 and is forecast to a readjusted size of USD 377 million by 2031 with a CAGR of 3.5% during review period.

Green picosecond laser is an ultrashort pulse laser with an output wavelength usually in the range of 532 nanometers. It is obtained by converting the fundamental wave (usually 1064 nanometer infrared laser) through double frequency technology (frequency doubling crystal). Its pulse width is in the order of picoseconds (10⁻¹² seconds), with the characteristics of high peak power, ultrashort pulse and low thermal effect. It is suitable for high-precision micromachining, material surface treatment, biomedical imaging and laser display. Green picosecond laser is favored for its low damage ability in processing transparent materials (such as glass) and heat-sensitive materials.
