Abstracts

The grid-connected microgrid includes multiple generators, power distribution systems, and complex controls. The main grid acts as the main power source for the grid-connected microgrid. These microgrids rely on the main grid for power balance and energy backup. Grid-connected microgrids generally have higher reliability than remote / island microgrids due to their connection to the main grid. The growth of the grid-connected microgrid market can be attributed to the expansion of utility-based grid networks and the large-scale use of renewable energy sources (such as offshore wind energy). Grid-connected microgrids can provide grid flexibility and improve quality. Their impact on the environment is small, thus driving demand for clean energy.

According to our (Global Info Research) latest study, the global Grid-connected Microgrid market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.
