Abstracts

The global Grid Forming Inverter market size is expected to reach $ 4414 million by 2032, rising at a market growth of 17.4% CAGR during the forecast period (2026-2032).

In 2025, global Grid Forming Inverter production reached approximately 12,000 units, with an average global market price of around USD 118,000 per unit.

The gross profit margin of major companies in the industry is between 24%–38%.

In 2025, the global production capacity of Grid Forming Inverter was approximately 16,000 units.

Grid Forming Inverters are power electronic devices capable of establishing and regulating voltage and frequency characteristics in electrical grids rather than simply following an existing grid waveform. They can provide voltage and frequency references, emulate inertia and damping characteristics, support fault recovery, and maintain stable operation under weak-grid or islanded conditions. These inverters are increasingly used in battery energy storage systems, renewable energy plants, microgrids, and hybrid power systems. Compared with conventional grid-following inverters, grid-forming technology can improve system strength, frequency stability, voltage support, and renewable energy integration. The product boundary covers dedicated inverter equipment and power conversion units with grid-forming control capabilities.

The upstream industry supplies power semiconductors, magnetic components, capacitors, control processors, sensors, cooling components, enclosures, protection devices, and energy storage interface components. The midstream industry integrates

these components into grid-forming inverter units through power conversion design, control software development, thermal management, protection integration, assembly, and system testing. Products may be configured for different voltage levels, power ratings, and energy storage architectures. The downstream market includes battery energy storage plants, renewable energy facilities, microgrids, hybrid power systems, and utility-scale power networks. Demand is driven by increasing renewable penetration, grid instability, weak-grid conditions, energy storage deployment, and the need for enhanced frequency and voltage stability.
