?A ground-based gas turbine is a device that converts the energy of fuel into mechanical work or electrical energy. ? It is mainly composed of three parts: a compressor, a combustion chamber and a turbine. It converts the energy of the fuel into mechanical energy or electrical energy through the processes of compressing air, combustion of fuel and air, and gas expansion. Ground-based gas turbines also have high starting ignition reliability and low flameout failure rate, and are especially suitable for environments with low air pressure.
