Abstracts

The global Ground Unmanned Combat Platform market size is expected to reach \$ 5484 million by 2032, rising at a market growth of 14.6% CAGR during the forecast period (2026-2032).

In 2025, the global production of ground unmanned combat platform reached approximately 34,100 units, with an average global market price of around US\$60,000 per unit. In the same year, the global total production capacity of ground unmanned combat platform reached 42,600 units. The industry average gross profit margin of this product reached 38%. Ground Unmanned Combat Platforms refer to unmanned ground systems that integrate autonomous driving, remote control, and artificial intelligence technologies to perform reconnaissance, patrol, support, and other tasks in terrestrial environments. These platforms typically consist of a mobile carrier, multi-source sensors, communication systems, and decision-making algorithms. They are capable of autonomous navigation, environmental perception, and task execution in complex environments, operating through human-machine collaboration or remote control. Their core objectives are to reduce personnel risks, improve operational efficiency, and enhance continuous operational capabilities in complex scenarios.

The GUCPS industry chain can be divided into three main segments: upstream core components, midstream system integration, and downstream applications. The upstream segment includes the supply of key hardware and software such as sensors, chips and computing platforms, communication modules, power systems, and chassis manufacturing. The midstream segment comprises system integrators and OEMs, responsible for platform design, autonomous driving algorithm development, multi-sensor fusion, and vehicle integration—the core value segment of the industry chain. The downstream segment consists of various application entities, including security

protection, emergency rescue, industrial inspection, and other units operating in complex environments. Overall, this industry is characterized by 'technology-intensive + complex system integration,' with midstream companies holding the core competitive advantage.

Ground Unmanned Combat Platforms have promising development prospects, with growth primarily driven by the demand for intelligent equipment upgrades, advancements in artificial intelligence and autonomous driving technologies, and increasing demand for unmanned operations in complex environments. As sensing technologies, edge computing, and low-latency communication continue to mature, the platform's autonomy and reliability will continue to improve, while its application scenarios are expanding from traditional fields to civilian applications such as emergency rescue, smart cities, and energy inspection. Future industry development will still be constrained by regulations, ethics, and safety control mechanisms, but the overall trend is towards becoming 'more intelligent, more collaborative, and more platform-based.'
