The measurement of hematocrit is an important diagnostic test in medical and laboratory settings. It provides information about the proportion of red blood cells to the total volume of blood and can help in the diagnosis and monitoring of various medical conditions such as anemia, dehydration, polycythemia, and blood disorders. Haematocrit tubes are disposable and designed for single-use to prevent cross-contamination between samples. They are calibrated to allow accurate measurement of the hematocrit value. In addition to medical diagnostics, haematocrit tubes may also be used in research laboratories for various applications involving the separation and analysis of blood components.

Haematocrit tubes, also known as microhematocrit tubes or capillary tubes, are small, thin glass or plastic tubes used to measure the volume percentage of red blood cells (hematocrit) in a blood sample.
