Abstracts

According to our (Global Info Research) latest study, the global Half-frame Mirrorless Camera market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A Half-frame Mirrorless Camera refers to a type of digital camera that uses a mirrorless design. The full-frame and half-frame of a camera refer to the size of the camera's photosensitive element (CCD/CMOS). Half-frame is also called APS-C frame, and the size of the photosensitive element is about 23.5×15.6mm. The size of the photosensitive element of a full-frame camera is about 2.3 times that of a half-frame camera. Although full-frame cameras have obvious advantages, the sensors, focus and other performance of current half-frame cameras are already quite advanced.

Therefore, for beginners in photography, half-frame cameras are a very good choice. The image quality of the center part of a half-frame camera is not much different from that of a full-frame camera, and it is more advantageous at the telephoto end, and can see farther. For example, the CCD size of a half-frame camera is about 2/3 of the film size. If a 70-200mm lens is installed, it becomes a 112-320mm lens after a 1.6x conversion, which is suitable for shooting distant views or "shooting birds". A 50mm fixed-focus lens is equivalent to 80mm, which has a good blur effect when shooting portraits.
