Abstracts

According to our (Global Info Research) latest study, the global Half Head Model market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

In 2024, global Half Head Model production reached approximately 871,354 units, with an average global market price of around US\$ 480 per unit. Half Head Model is a three-dimensional anatomical model made according to the actual proportions of the human skull and neck, partially cut along the sagittal or coronal plane, used to demonstrate the spatial relationship between the soft and hard tissues of the head. Based on medical anatomy standards, this model is made using processes such as sculpting, injection molding, resin casting, silicone simulation, or 3D printing reconstruction, and is widely used in medical teaching, clinical training, patient communication, anatomical imaging comparison, skills training, and scientific research simulation.

Gross Profit Margin Level

In the niche market of half-head models, the overall gross profit margin is at a medium-to-high level. The costs of upstream PVC/resin, silicone, and 3D printing materials do not account for a large proportion of the unit cost structure; manual painting, mold development, 3D modeling, and small-batch production management are the main cost items. Typical European and American brands (such as 3B Scientific, Erler-Zimmer, SOMSO, Nasco, etc.) rely on stable distribution channels and brand premiums, and their standard educational half-head models generally have a gross profit margin of 40%?55%. Meanwhile, Chinese and Indian manufacturers relying on OEM production have a gross profit margin of approximately 20%?30% at the factory end, and through

international distributors and centralized procurement of educational equipment, they can still maintain an overall gross profit margin of 30%-40% at the end-sales stage. High-end customized products (such as 3D-printed case models, imaging-specific Phantoms, and soft tissue injection training halves) often boast gross profit margins exceeding 50% due to their low order volume, high technical barriers, and long delivery cycles. This significantly boosts profits despite their limited overall revenue share.

Industry Drivers: The expansion of the half-head model market is driven by several factors. First, the number of medical schools, nursing schools, and related medical technology education institutions worldwide continues to increase. Anatomy and neuroscience courses have not seen a decrease in reliance on high-quality physical models due to digitization; instead, a hybrid teaching trend of 'physical models + 3D software/AR anatomy' is emerging. Half-head models, with their integrated representation of the brain, cranial nerves, and upper respiratory and digestive tracts, have become an essential component in basic treatment packages. Second, the advancements in surgical precision and minimally invasive techniques have led to increased reliance on visual aids for teaching and patient communication in neurosurgery, otolaryngology, oral and maxillofacial surgery, and anesthesiology. The frequency of use of half-head models in surgical procedure explanations, postoperative follow-ups, and resident physician training has significantly increased. Secondly, increased investment in medical education in emerging markets has led to a surge in demand for mid-to-high-end anatomical models, particularly half-head and head-neck models, through e-commerce platforms and regional agents. This has driven rapid growth in the sales of mid-to-low-priced products. Simultaneously, the maturity of 3D printing and soft material simulation technologies has expanded high-value-added applications such as image registration, surgical planning, and injection training, enhancing the strategic importance of half-head models in overall anatomical model sets. Finally, the development of cross-border e-commerce and professional distribution platforms (such as GTSimulators and Anatomywarehouse) has significantly lowered the procurement barriers for small and medium-sized institutions and individual users, expanding the demand for half-head models from traditional 'large-scale equipment for universities' to include individual learners, art studios, and film production companies, creating a more diversified demand structure.
