## Abstracts

According to our (Global Info Research) latest study, the global Half-row Berry Harvester market size was valued at US\$ 19.2 million in 2024 and is forecast to a readjusted size of USD 21.7 million by 2031 with a CAGR of 1.8% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A half-row berry harvester is an agricultural machine designed to harvest berries from only one side of a row of plants at a time. Unlike full-row harvesters, which cover the entire row width in a single pass, half-row harvesters are narrower and typically require two passes to harvest both sides of the row. These machines are often used in smaller-scale farming operations, in fields with narrow row spacing, or in areas where maneuverability is important. Half-row berry harvesters are typically more compact and less expensive than full-row models, making them suitable for farms with less extensive berry acreage or challenging terrain. They are commonly used to harvest berries such as blueberries, raspberries, and blackberries.
