Abstracts

According to our (Global Info Research) latest study, the global Half Tone Mask market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The half tone mask is a translucent light-shielding film attached to the photomask, which reduces the propagation speed of light when passing through the material, thereby locally changing the phase of the pattern part. The phase change occurs through the translucent light-shielding film, and The interference phenomenon between the light that has not passed through the translucent light-shielding film and whose phase has not changed improves the resolution. When used, traditional masks only show two effects: light transmission and opaqueness for light of a specific wavelength, while halftone masks include graphic structures with fully transparent, fully opaque, and partially transparent effects. Reducing the photolithography process and reducing the number of masks used has now become the main product of choice for major panel manufacturers.
