Abstracts

According to our (Global Info Research) latest study, the global Hall Effect Switch ICs market size was valued at US\$ 1055 million in 2024 and is forecast to a readjusted size of USD 1754 million by 2031 with a CAGR of 7.6% during review period.

Hall Effect Switch ICs are electronic devices that use the Hall Effect phenomenon to detect the presence of a magnetic field and provide a digital output signal based on its presence or absence. The Hall Effect is a physical phenomenon where a voltage difference (Hall voltage) is generated across a conductor or semiconductor material when it is subjected to a perpendicular magnetic field and a current flows through it.

The global market for semiconductor was estimated at US\$ 579 billion in the year 2022, is projected to US\$ 790 billion by 2029, growing at a CAGR of 6% during the forecast period. Although some major categories are still double-digit year-over-year growth in 2022, led by Analog with 20.76%, Sensor with 16.31%, and Logic with 14.46% growth, Memory declined with 12.64% year over year. The microprocessor (MPU) and microcontroller (MCU) segments will experience stagnant growth due to weak shipments and investment in notebooks, computers, and standard desktops. In the current market scenario, the growing popularity of IoT-based electronics is stimulating the need for powerful processors and controllers. Hybrid MPUs and MCUs provide real-time embedded processing and control for the topmost IoT-based applications, resulting in significant market growth. The Analog IC segment is expected to grow gradually, while demand from the networking and communications industries is limited. Few of the emerging trends in the growing demand for Analog integrated circuits include signal conversion, automotive-specific Analog applications, and power management. They drive the growing demand for discrete power devices.
